

Add DNS to the core switch

Overview

Connect to your switch using a web browser. Once connected navigate to the following location Configuration --> System --> IP DNS Configuration To set the required DNS server, simply edit the 'DNS Server' section on the IP screen. I am not sure this feature still remains in newer IOS. This guide covers CLI commands for setting up DHCP pools, excluding addresses, defining default gateways and DNS servers, and configuring switch DNS. One domain suffix can also be configured to support resolution of DNS names in that domain by using a host name only. Further installation requires a Console and Internet connectivity via the management port! If the switch has pre-installed network operating system (NOS), it needs to be uninstalled first. To uninstall the current NOS, access ONIE from the GRUB menu and select the Uninstall OS option.
