

Core Switch One device cannot access it

Overview

Check whether the interfaces between the access and core switches are in the forwarding state. Particularly, check whether certain functions supported block the interfaces. 0 uplink trunk port enabled allowed vlan. I've got a network setup similar to this <https://community.3650switch.com> - as a core and 2960 as an access switch. I can ping core switch from router and vice versa, but I cannot ping access switch even. A device can be pinged from core switch (router) but not the switch it's plugged into. It is currently using the lan interface, the address that you need to use for the NAT is the WAN outside interface with the public IP - in this case gi0/0/0 The Router is set to use the wrong interface for the NAT overload. I'm sure I removed the correct VLANs. When I saved the configuration, everything stopped working and now we don't know what to do.
