

# Direct connection to pigtail without splitter

## Overview

A PON circuit breaker is built without the traditional pigtail wire. When the installer mounts the breaker onto the panel's hot bus bar, this contact simultaneously plugs into the dedicated neutral bus. A pigtail serves as a bridge between multiple conductors and a single terminal. These short wire segments solve space constraints in junction boxes by creating a central hub. It's a short wire with a connector installed on one end, such as a spade or ring terminal, while the other is left bare or blank. Common termination methods include no-epoxy-no-polish, epoxy and. Whether you're upgrading outlets or managing industrial circuits, these short connectors ensure power flows smoothly even when devices fail.
