

Fiber optic cable directly plugged into the router

Article Overview

A standard fiber optic cable cannot be directly plugged into most home routers; it must first connect to an Optical Network Terminal (ONT) or a fiber-compatible router port.

Why Direct Connection Usually Doesn't Work

Fiber optic cables transmit data as light signals, which are incompatible with the electrical signals used by standard routers. The fiber line from your ISP typically terminates at an ONT, which converts the optical signal into an Ethernet signal that your router can understand . Without this conversion, a standard router cannot interpret the data, and direct connection is not possible.

Typical Setup

- **Fiber Cable to ONT:** The fiber cable from the wall outlet connects to the ONT using a specialized connector, usually SC/APC or SC/UPC .
- **ONT to Router:** An Ethernet cable runs from the ONT's LAN port to the router's WAN port. This allows your router to distribute the internet connection to your devices via Wi-Fi or wired connections .
- **Router Configuration:** After connecting, you may need to enter ISP credentials in the router's admin panel and ensure firmware is up to date for optimal performance .
