

How should the cables in the distribution box be installed

Article Overview

Cables in a distribution box should be installed with proper preparation, correct terminal connections, neat arrangement, and thorough testing to ensure safety and reliable operation.

Preparation and Box Installation

Before wiring, select a distribution box suitable for the environment (indoor/outdoor) and load capacity, ensuring it meets IP or NEMA ratings for protection against dust and moisture . Mount the box on a stable surface at an appropriate height (typically around 1.5 meters for residential installations) and secure it with screws or expansion bolts, making sure it is level and stable . Leave sufficient space around the box for ventilation and maintenance.

Wire Preparation

Cut the insulation of each wire to the required length, exposing enough conductor to make a secure connection without leaving excess exposed wire that could cause short circuits . Use a wire stripper to remove insulation cleanly and avoid damaging the conductor.

Terminal Connections
