

How to ground the protective resistor in a distribution box

Overview

Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). The ground resistance between all system parts shall be $< .$ Power from factory ground must be installed by a qualified electrician. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. Whether you're a seasoned pro or just starting out, this comprehensive guide will give you practical. Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel. Equipment Protection: Grounding protects substation. While a PCB engineer focuses on preventing a short circuit from frying a microcontroller, a power systems engineer is focused on preventing a ground fault from vaporizing a multi-million dollar generator or transformer.
