

Methods for connecting fiber optic cables to switches

Article Overview

Connecting fiber optic cables to network switches requires selecting the correct SFP module, using duplex fiber cables, and ensuring proper port and connector alignment for reliable high-speed data transmission.

Understanding Fiber-Ready Switches

Most modern network switches include SFP (Small Form-factor Pluggable) or SFP+ slots for fiber connections, supporting 1G or 10G speeds respectively. Some switches also feature combo ports, which share a logical connection between an RJ45 copper port and an optical port, but only one can be active at a time. Identifying your switch type and supported port is the first step before connecting fiber.

Choosing the Right Fiber and SFP Module

- Single-mode fiber (SMF): Ideal for long-distance connections (over 1 km), typically using 1310nm or 1550nm wavelengths.
- Multi-mode fiber (MMF): Suitable for short-distance connections (under 1 km), usually with 850nm wavelength.
- SFP modules: Must match the fiber type and speed. SFP modules are for 1G links, SFP+ for 10G, and QSFP modules for higher bandwidth.
- Duplex connections: Fiber transceivers require two strands—one for transmitting and one for receiving. Ensure the fiber patch cords are duplex LC-style connectors and that connections are reversed between switches (A to B, B to A).
