

Multimode fiber can transmit up to 5km

Overview

Multimode fiber, with its larger core diameter and multiple propagation modes, is limited by modal dispersion, restricting its use to short-distance, high-speed data transmission. The primary multimode fiber types are OM1, OM2, OM3, OM4, and OM5. Each type has specific characteristics that affect its maximum distance and performance, especially at higher data. Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Common applications include Local Area Networks. Multimode fiber transmits multiple light paths simultaneously through a larger core (typically 50-62.
