

Photovoltaic cable tray installation in Tunisia

Article Overview

Cable tray installation for PV systems in Tunisia requires adherence to ANME technical guidelines, use of certified solar cables, and compliance with local safety and quality standards.

Technical Guidelines and Standards

In Tunisia, photovoltaic installations must follow the ANME guide for PV systems and the technical reference for grid-connected low-voltage PV installations. These documents outline the minimum technical requirements for design, installation, and maintenance, emphasizing safety for personnel and equipment. Installers must be certified under the PROSOL Elec program, ensuring compliance with quality and safety standards.

Cable Tray Design and Installation

- **Material and Type:** Use durable, corrosion-resistant cable trays suitable for outdoor solar installations. Materials like galvanized steel or aluminum are commonly recommended.
- **Routing:** Cable trays should follow the shortest and safest path from PV modules to inverters and combiner boxes, avoiding sharp bends and mechanical stress.
- **Separation:** Maintain separation between DC and AC cables to reduce electromagnetic interference and ensure safety.
- **Support and Spacing:** Trays must be securely mounted with supports at regular intervals, typically every 1-2 meters depending on tray type and cable weight.
