

Rotating Fiber Optic Communication

Overview

In optical processes, the most commonly used technology is based on the use of Fiber Optical Rotary Joints (FORJ), which are transmitted via fiber optic cables. This method enables high data rates, but is comparatively expensive, sometimes prone to wear and usually complex to install. The SPINNER builds fiber-optic rotary joints (FORJs) available up to 109 channels and any fiber type: single-mode, multi-mode or large-core. Fiber Optical Rotary Joint, commonly known as FORJs, are a class of devices engineered to be the backbone of rotational freedom in. A fiber optic rotary joint, also known as a fiber optic slip ring or rotary coupler, is a device that allows the transmission of light signals through an optical fiber while allowing rotation between two connected parts. Single-mode or multi-mode fibres for single or multi-channel transmission.
