

What size wire should the jumper wire in the distribution box be

Article Overview

For jumper wires in a distribution box, a solid insulated copper wire of 22 to 32 AWG is typically recommended, with the exact gauge chosen based on the current it must carry.

Recommended Wire Gauge

Jumper wires in distribution boxes should generally use solid, insulated, plated copper wire in the 22 to 32 AWG range, with heat-resistant insulation such as Teflon (PFA) to withstand soldering temperatures if applicable . The exact gauge depends on the current load the jumper will carry: higher currents require thicker wires, while low-current signal jumpers can use thinner gauges . For standard branch circuits in residential or commercial distribution boxes, main wiring often uses 2.5 mm² or 4 mm² wires, but jumper wires connecting terminals or bridging points are usually much smaller, as they carry minimal current .

Insulation and Routing

- Use insulated wire to prevent accidental shorts. Teflon insulation is common due to its heat resistance .
- Ensure the jumper wire is routed with minimal bends and does not pass over component leads, heat sinks, or test points .
- Provide stress relief near solder joints or connection points to prevent mechanical failure .
